

## ADDENDUM TO THE PERFECT DESCENT OPERATIONS MANUAL

This unit includes the new Dual Spring retraction system. This system adds redundancy to the retraction system.

With this system there are new, additional inspection requirements. Please follow these instructions in addition to all other inspection criteria specified in the Perfect Descent Operation Manual.

Inspection should be done daily with the auto belay mounted to the wall and the lanyard extended.

The amount of lanyard extended must be greater than 65% of the stated lanyard length of the device.

At this point, the retraction force (amount of upward pull) must be greater than 4.5lb(2Kg). A simple test method is to connect a small weight of 4.5(2Kg) to the carabiner. With this weight attached the lanyard must stay in place or begin to retract. Use caution not to lose control of the lanyard allowing it to retract beyond your reach.

If the additional weight descends, the unit must be removed from use and returned to a Perfect Descent Factory Authorized Service Center. Please refer to the Perfect Descent Operation Manual for more information.
